CarnegieMellon

The *Past* of Macromodeling...

- Not without its own glories...
- Not always easy to decipher
- Not always easy to use...

The Questions are Ancient, and Profound ...

- Archaeologists' reconstruction
- New excavation: Temple of Ductorh

Earliest known attempt
at 3D full-wave model equations—
sadly, incomplete

Remarkably ahead of its time...

© R.A. Rutenbar 2003 Slide 3

The Essential Themes Recur Thru History...

"The Allegory of St. Darlington," from Pane 37, North window, Central vault, Notre Linear

© R.A. Rutenbar 2003 Slide 4

So Why A “Glorious Future” ...?

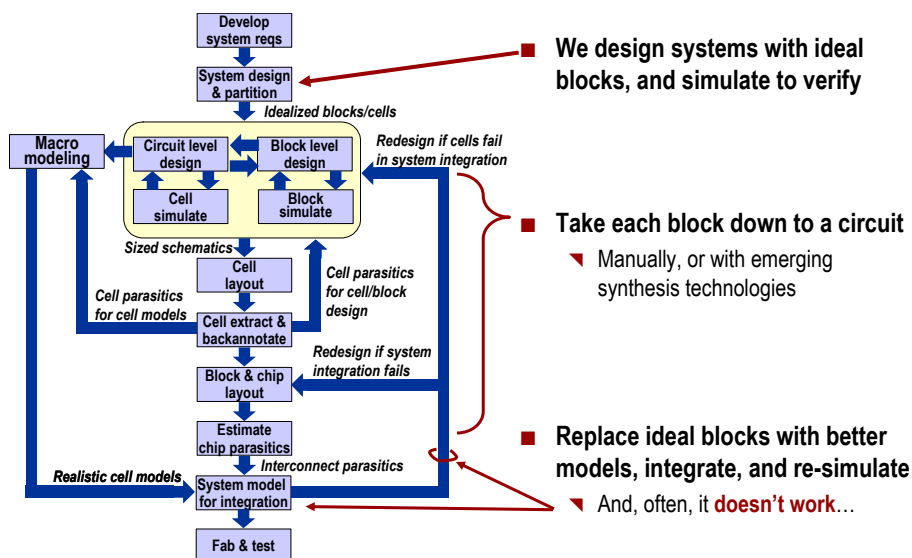

1. Exciting new ideas

- ▼ Projection-based nonlinear MOR
- ▼ Volterra-based nonlinear MOR
- ▼ Time and frequency modeling
- ▼ Noise modeling
- ▼ Symbolic modeling
- ▼ Design space modeling
- ▼ Data mining concepts
- ▼ Synthesis applications
- ▼ Etc etc etc

2. We have NO other choice

No Choice...? Today, Flows Look Like This

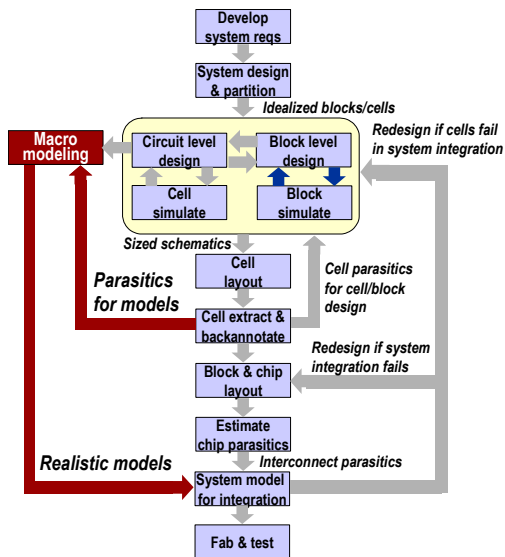

■ We design systems with ideal blocks, and simulate to verify

■ Take each block down to a circuit
 ▼ Manually, or with emerging synthesis technologies

■ Replace ideal blocks with better models, integrate, and re-simulate
 ▼ And, often, it **doesn't work**...

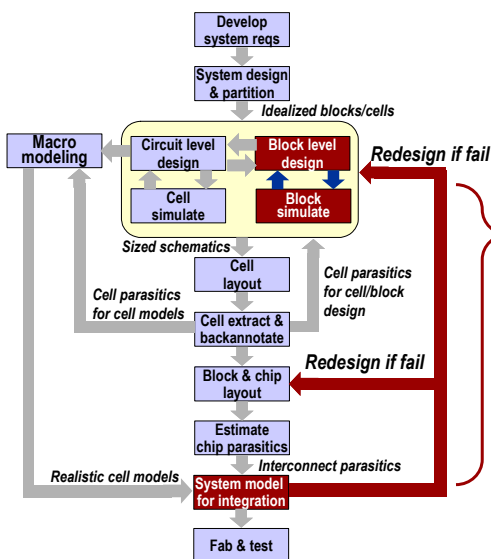

Model-Building Methods Still Weak, Limited

- Models often still done **by hand**, by experts who understand the circuits and the system

© R.A. Rutenbar 2003 Slide 7

Model-Building Methods Still Weak, Limited

- Especially problematic as we start to rely on macromodels for full-system design **closure**

© R.A. Rutenbar 2003 Slide 8

About This Talk...

- Pieces of macromodeling puzzle
 - High-level taxonomy of approaches
- New piece of puzzle: *data mining* ideas
 - What they are, where they seem useful

*regression-based
trajectory-based
volterra kernels...*

*time domain
frequency domain
symbolic models
data mining...*

Some Context: My Focus is Mixed-Signal

% Design Effort

Digital

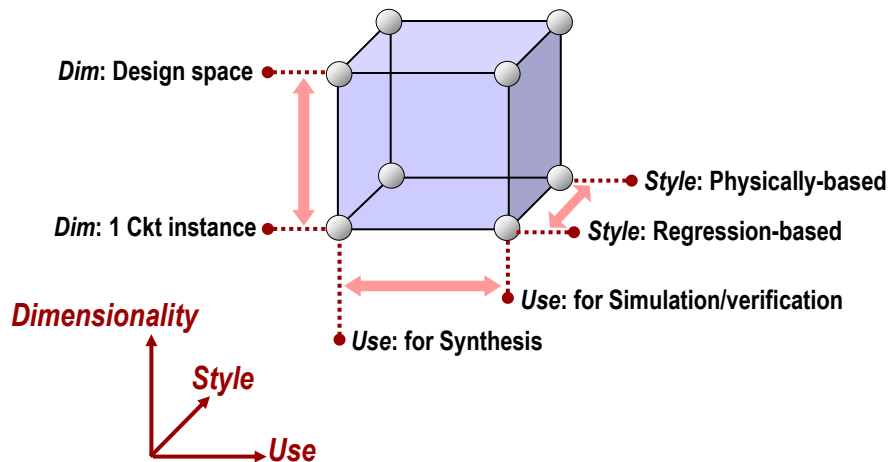

Analog

Commercial Mixed Signal ASIC

What Kind of “Macromodel” Do We Mean?

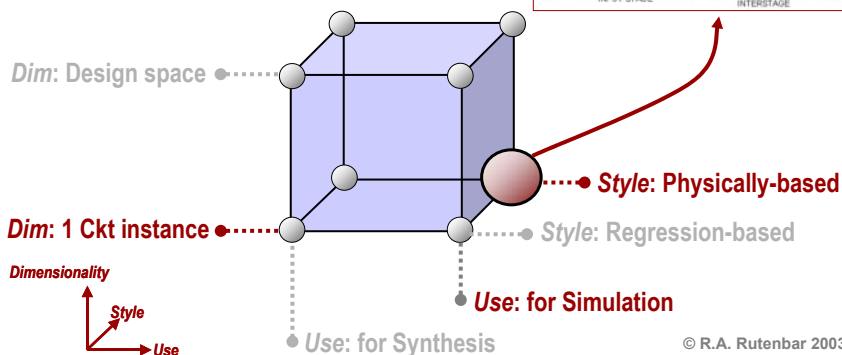

- Term “**macromodel**” means different things to different people...

© R.A. Rutenbar 2003 Slide 11

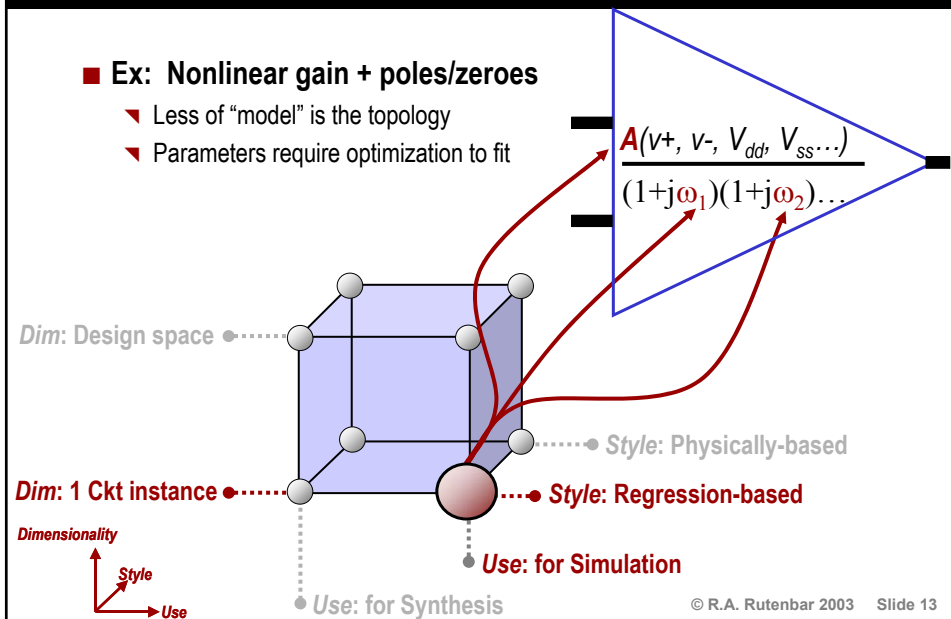

Earliest Models: Physical, for Simulation

- Ex: Boyle opamp [JSSC Dec'74]
 - ▼ Most of the “model” is circuit topology
 - ▼ Parameters easy to pick off original ckt

© R.A. Rutenbar 2003 Slide 12

Later Models: More Regression, for Simulation

© R.A. Rutenbar 2003 Slide 13

Essential Problems in All Macromodeling

■ What do you fit *to*

- ▼ What's the template/structure?

■ Options

- ▼ A simplified circuit
- ▼ A “black box” curve fit
- ▼ A nice mathematical form
 - ▼ Pole zero form $H(s)$
 - ▼ Linear ODE
 - ▼ Nonlinear ODE
 - ▼ Volterra series
 - ▼ ...

■ *How* do you fit to it?

- ▼ What's the mathematics of “fit”?

■ Options

- ▼ By hand (ask someone smart)
- ▼ Nonlinear regression
- ▼ A nice mathematical recipe
 - ▼ Linear: **AWE, PVL, Arnoldi, PRIMA...**
 - ▼ Nonlinear: **Volterra, posynomial...**
- ▼ Special purpose (common circuits)
 - ▼ Opamp, VCO, mixer, PFD-CP
 - ▼ ...

© R.A. Rutenbar 2003 Slide 14

Today's Spectrum of Modeling for Simulation

$$\frac{A(v^+, v^-, V_{dd}, V_{ss} \dots) (1+j\omega_a)(1+j\omega_b) \dots}{(1+j\omega_1)(1+j\omega_2) (1+j\omega_3) \dots}$$

© R.A. Rutenbar 2003 Slide 15

Today's Spectrum of Modeling for Simulation

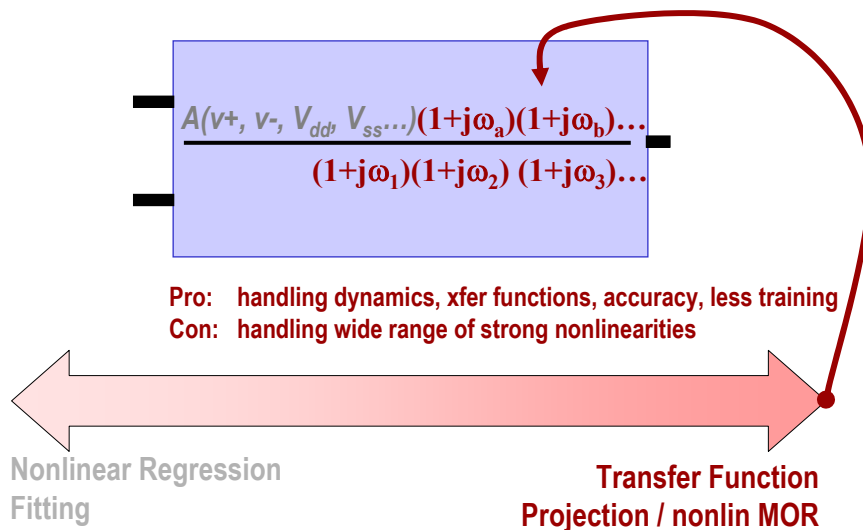

$$\frac{A(v^+, v^-, V_{dd}, V_{ss} \dots) (1+j\omega_a)(1+j\omega_b) \dots}{(1+j\omega_1)(1+j\omega_2) (1+j\omega_3) \dots}$$

Pro: handling strong nonlinearities
 Con: handling dynamics, accuracy guarantees, training data

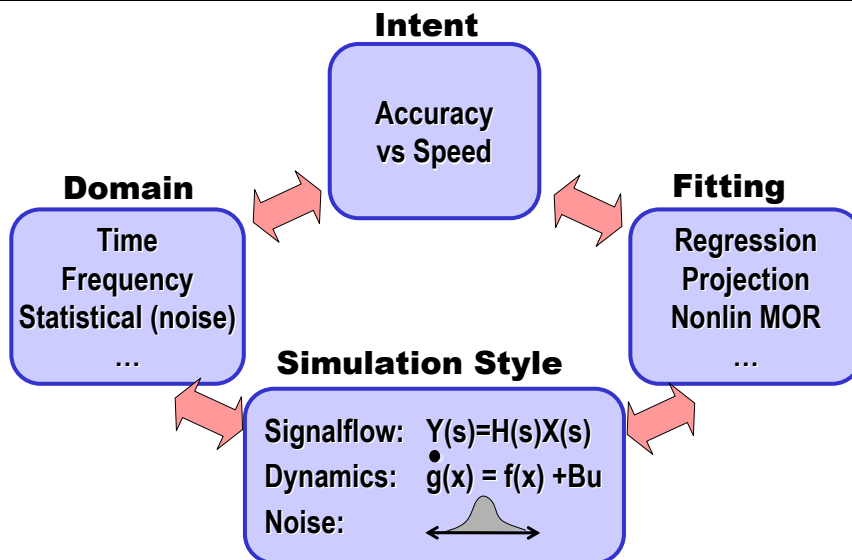

© R.A. Rutenbar 2003 Slide 16

Today's Spectrum of Modeling for Simulation

© R.A. Rutenbar 2003 Slide 17

End-Use Diversity Complicates Problem

© R.A. Rutenbar 2003 Slide 18

...As Do User Expectations

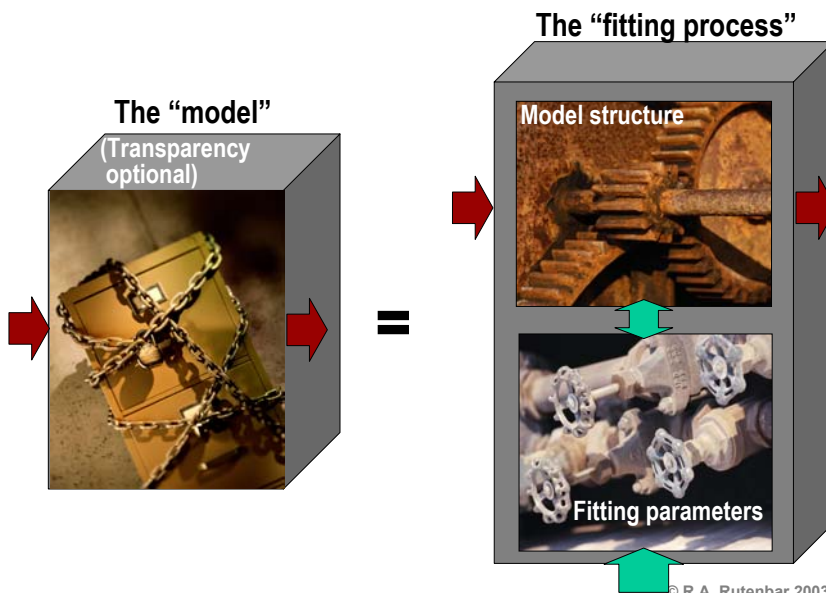

- Like simulator controls, everybody hates having to “twiddle” model details

- This is what every designer *ultimately* wants

© R.A. Rutenbar 2003 Slide 19

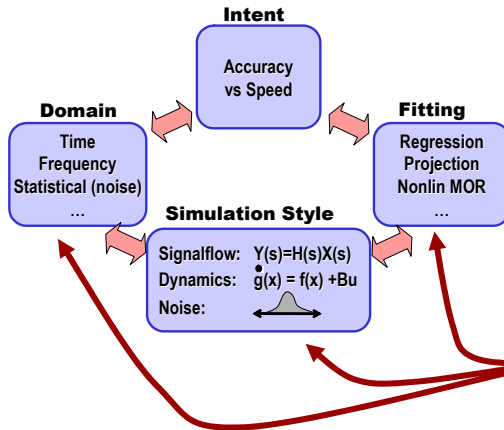

Today's Models Don't Always Inspire Confidence

© R.A. Rutenbar 2003 Slide 20

...But, Recent Ideas Offer New Hope

- ...so, I'll let other speakers cover these

2003 IEEE International Workshop on Behavioral Modeling and Simulation: Advance Program

Tuesday, October 7

Plenary Session

Host: Monte Mar, Orora Design Technologies

8:30 AM Welcome

8:40 AM

Keynote The Glorious Future of Macromodeling (in a Nutshell)
Rob Rutenbar, Carnegie Mellon University

9:40 AM

Tutorial Automated Model Generation Methods for Electronic Systems
Jaljeet Roychowdhury, University of Minnesota

10:25 AM Break

Session 1: Automatic Model Extraction

10:45 AM A Model Reduction Approach to Generating Geometrically Parameterized Spiral Inductor Models
Luca Daniel and Jacob White, Massachusetts Institute of Technology

11:10 AM Modeling Nonlinear Communication ICs Using a Multivariate Formulation
Peng Li and Lawrence T. Pileggi, Carnegie Mellon University

11:35 AM Modeling Memory Effects in Nonlinear Subsystems by Dynamic Volterra Series
E. Ngoya and A. Soury, University of Limoges

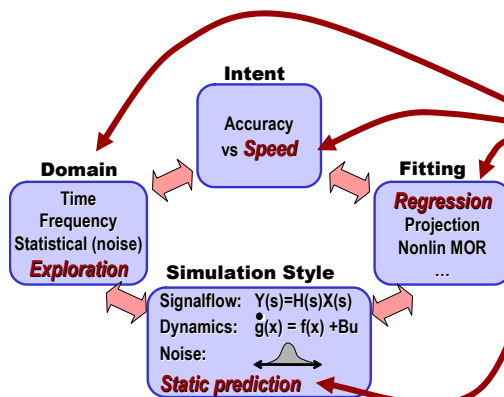

12:00 noon Symbolic Model Order Reduction
Bo Hu, Guoyong Shi and Richard Shi, University of Washington

12:25 PM

Invited A Statistical Perspective on Nonlinear Model Reduction
Joel Phillips, Cadence Design Systems

© R.A. Rutenbar 2003 Slide 21

...and I'll Talk About Something *Different*...

New Motivation: Large Analog Design Spaces

- Emerging commercial infrastructure makes it easy to sample large populations of fully qualified (*simulated*) circuit configs

- ▼ **Optimization engine:** proposes circuit solution candidates
- ▼ **Evaluation engine:** evaluates quality of each candidate
- ▼ **Full SPICE evaluation:** for every spec, for every candidate

© R.A. Rutenbar 2003 Slide 23

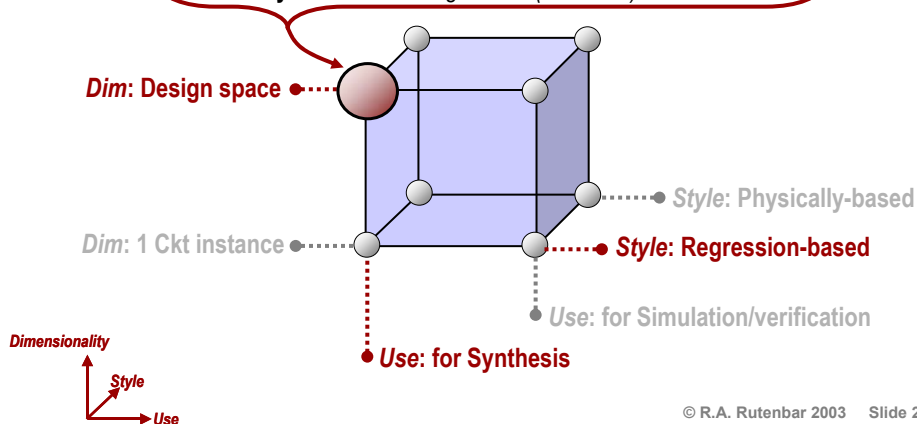

Macromodeling in this New Context

- Modeling analog **design spaces** for synthesis uses

Dimensionality: *populations of circuits, high-dimensional data*

Use: *early estimation of feasibility or performance trade-offs*

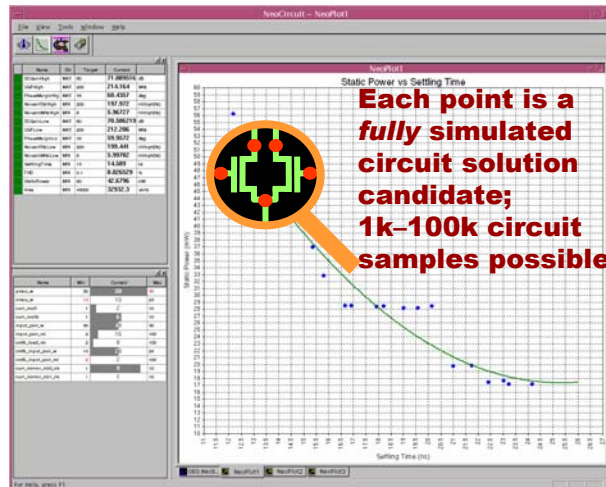

Style: *nonlinear regression (curve-fits)*

© R.A. Rutenbar 2003 Slide 24

New Opportunity: *Design Space Modeling*

- Can generate 1K – 100K fully-qualified (simulated) samples of **large analog design spaces** – what can we do with this data?

Courtesy Neolinear, Inc. September 2003 Slide 25

New Idea: Macromodeling as *Data Mining*

- **Problem:** Can we **fit** these large populations in useful ways?
 - ▼ **1K – 100K** data points? Conventional, *ad hoc* curve fitting not up to the task
 - ▼ Where do we look to do better?
- **Solution:** **Data mining**
 - ▼ Significant breakthroughs in last 5 years in this community
 - ▼ **Techniques for extracting (fitting) patterns, predictive formulas, or classifiers to large amounts of high-dimensional, possibly noisy, data**

Basic Problems in Nonlinear Regression

■ Data selection

- ▼ Where does data come from?
- ▼ **Focus: simulation-based search**

■ Model selection/fitting

- ▼ What functional form to fit populations of high-dim ckts?
- ▼ **Focus: boosted regressors**

■ Model validation

- ▼ How do you tell if you "fit well"?
- ▼ **Focus: rigorous model selection**

© R.A. Rutenbar 2003 Slide 27

Aside: this is "Black Box" Modeling

■ We want to assume very **little** about base model template

- ▼ **Black box** = from data points alone, deduce and parameterize a model that accurately predicts basic behavior

© R.A. Rutenbar 2003 Slide 28

Essential Regression Problem

- Very hard to find **one** functional form that fits **everywhere**

- ▼ Often easy to find regressors that can fit locally, but not globally
- ▼ Problem gets worse with more data, with more dimensions

- Could we **find**, then **combine**, a set of such regressors?

© R.A. Rutenbar 2003 Slide 29

Elegant Strategy: **Boosting** [Freund, Schapire, 97]

- Build a **sequence** of regression models, then **combine** them

- ▼ Strategy for sequentially resampling/reweighting data, voting = **boosting**

© R.A. Rutenbar 2003 Slide 30

Ensemble Strategy: Boosting

- Build a *sequence* of regression models, then *combine* them

▼ Strategy for sequentially resampling/reweighting data, voting = **boosting**

© R.A. Rutenbar 2003 Slide 31

Ensemble Strategy: Boosting

- Build a *sequence* of regression models, then *combine* them

▼ Strategy for sequentially resampling/reweighting data, voting = **boosting**

© R.A. Rutenbar 2003 Slide 32

Boosting Specifics

■ Individual regressors

- ▼ Neural networks in MATLAB. 2-hidden layers, 10 neurons/layer
- ▼ Chosen for ease-of-use mainly

■ Boosting mechanics

- ▼ Fit **N** networks, in stages, with resampling/reweighting [see our **DAC02** paper]
- ▼ Well-fit data points can **vanish** from the population, over iterations
- ▼ Poorly fit points can **replicate** in the population, over iterations

■ To combine regressors, more data mining: *instance methods*

- ▼ Ask the **K nearest neighbor points** from training data what they think...

© R.A. Rutenbar 2003 Slide 33

Instance-Based Voting of Regressors

■ Suppose we set **K=2** nearest neighbors (**K** is *arbitrary*)

- ▼ For any new data point, find **2** nearest training data points, and use the regressor that gave the most accurate prediction at that neighbor point

© R.A. Rutenbar 2003 Slide 34

Instance-Based Voting of Regressors

- Suppose we set $K=2$ nearest neighbors (K is arbitrary)
 - ▼ For any new data point, find 2 nearest training data points, and use the regressor that gave the most accurate prediction at that neighbor point

© R.A. Rutenbar 2003 Slide 35

Instance-Based Voting of Regressors

- Suppose we set $K=2$ nearest neighbors (K is arbitrary)
 - ▼ For any new data point, find 2 nearest training data points, and use the regressor that gave the most accurate prediction at that neighbor point

© R.A. Rutenbar 2003 Slide 36

About Boosting

■ Independent of the regressor (curve fitting) style

- ▼ Use a neural net, a polynomial, posynomial, spline model, **whatever you like**

■ Many regressors are fit; few are evaluated

- ▼ Not uncommon in large problems to boost 100 rounds of regressors
- ▼ But—our instance-based technique only evaluates the **best** regressor on each of the K neighbors **nearest** the evaluation point

■ Standard data structures to get K nearest neighbors fast

- ▼ High-dimensional nearest neighbor lookup is a **well studied** problem
- ▼ Quad trees, kd-trees, R-trees, S-trees, flat vector scans, etc

© R.A. Rutenbar 2003 Slide 37

What Overall “Boosted” Model Looks Like

■ Basic model setup

- ▼ ~10-20 boosted regressors $R_i()$
- ▼ Save training data points

■ Basic model eval

- ▼ Given a new “query point” x_q
- ▼ Select a subset of stored data pts
- ▼ Chooses *which* regressors to eval, *how* to combine (weighted vote)

© R.A. Rutenbar 2003 Slide 38

Simple RF Design Space Example

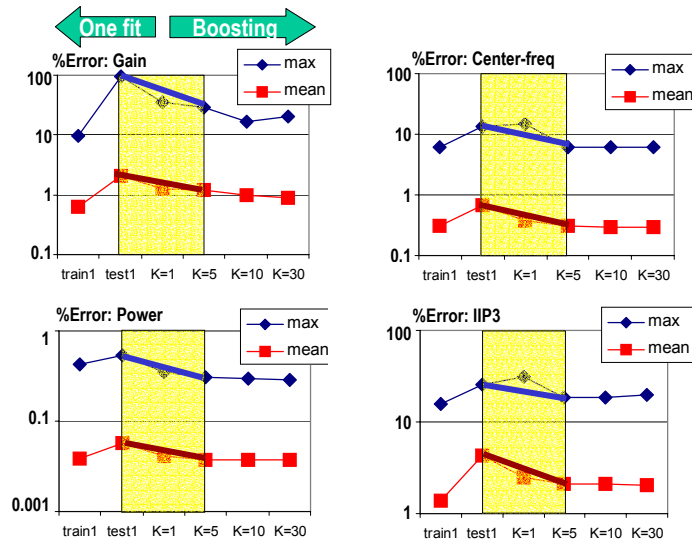

Simple RF LNA topology

- 5 independent variables
- ~2000 HSPICE-simulated designs
- Use half to **train** boosted predictors
- Use other half to **test** predictors

© R.A. Rutenbar 2003 Slide 39

Simple RF Design Space Results

© R.A. Rutenbar 2003 Slide 40

Example Synthesis Data Set

Gain: 70dB
UGF: 460Mhz
Power: 13.5mW
SlewRate: 360 V/us
SettlingTime: 4.75ns
PhaseMargin: 60°
Offset: 2.6uV

Courtesy Neolinear, Inc.

■ Industrial synthesis result

- ▼ CMOS amplifier ~50 devices
- ▼ 27 design inputs (independent vars)
- ▼ 12 outputs (performance specs)

■ We have...

- ▼ ~40,000, 27-dimensional data points

© R.A. Rutenbar 2003 Slide 41

Data Points from Circuit Synthesis

■ New problems

- ▼ Synthesis visits many fully-qualified (simulated) samples of space...
- ▼ ...but synthesis may **not** sample in ways optimized for modeling
- ▼ To illustrate this, we fit **first** and **last ~20%** of time-ordered synthesis samples here; first samples have wider variance; last samples have less.

For modeling, want **widest** distribution of samples

Synthesis focuses sampling toward **"best"** ckt for target goals

© R.A. Rutenbar 2003 Slide 42

Boosted Results from Synthesis

© R.A. Rutenbar 2003 Slide 43

Boosted Results from Synthesis

© R.A. Rutenbar 2003 Slide 44

Qualitative Effects on Prediction Error

- Often, better worst-case error, and better mean error

- ▼ Test1 is a single, conventional neural net regressor
- ▼ K=1 to 30 show 10 boosted regressors, with up to 30 neighbors voted
- ▼ K=small can help both max and mean; but you can also over-boost

© R.A. Rutenbar 2003 Slide 45

Fraction of Points Choosing Each Regressor

- 10 regressors boosted.
- For training points, what **fraction** “believes” the i^{th} regressor to be **best**, locally?
- This is an informal measure of the utility of boosting to adapt an ensemble of models
- Note, **not** always true that 1st regressor dominate all others

© R.A. Rutenbar 2003 Slide 46

Issue: How Much “Model” is “Enough Model”?

- Can always add complexity to any individual regression model

- Problem: **Overfitting**

- ▼ Easy to build more model than the data can really support

- Classical **Bias-Variance Tradeoff**

- ▼ With more complexity...

- ▼ Bias error **grows**:

$$\mathbb{E}[\hat{f}(\mathbf{x})] - \mathbb{E}[f(\mathbf{x})]$$

- ▼ But variance error **shrinks**:

$$\mathbb{E}[(\hat{f}(\mathbf{x}) - \mathbb{E}[\hat{f}(\mathbf{x})])^2]$$

More
fitting
error

More model complexity
e.g., bigger neural net,
more boosting cycles

© R.A. Rutenbar 2003 Slide 47

Solution: Rigorous Model Selection

- Generic model selection

- ▼ **Divide** the data into training set and test set.
 - ▼ **Increase** model complexity step by step
 - ▼ **Fit** each of these models
 - ▼ **Choose** the right model based on the test error

- Can be applied to our macromodeling approach

- ▼ Base regressor selection: what is **best** single regressor ?
 - ▼ Boosting complexity selection: given right base regressor, how much boosting, etc., is **best**?

© R.A. Rutenbar 2003 Slide 48

Solution: Rigorous Model Selection

■ Generic model selection

- ▼ **Divide** the data into training set and test set.
- ▼ **Increase** model complexity step by step
- ▼ **Fit** each of these models
- ▼ **Choose** the right model based on the test error

■ Can be applied to our macromodeling approach

- ▼ Base regressor selection: what is **best** single regressor ?
- ▼ **Boosting complexity selection:** **given right base regressor, how much boosting, etc., is best?**

© R.A. Rutenbar 2003 Slide 49

How Much Boosting & How Many Neighbors?

■ Experiment

- ▼ Run 2-16 boost cycles, and try 1-50 nearest neighbors to vote regressors
- ▼ Pick the **best** model we see in this set of experiments

Model Selection	Boost 2 cycles	Boost 4 cycles	Boost 6 cycles	Boost 8 cycles	Boost 10 cycles	Boost 12 cycles	Boost 14 cycles	Boost 16 cycles
K=1 nearest neighbors								
K=5								
K=10								
K=30								
K=50								

© R.A. Rutenbar 2003 Slide 50

Model Selection: Center Freq Model for RF LNA

■ Don't always need a lot of boosting/neighbors

- ▼ Mean Square Error **-18%**; Max error rate **-21%**; Mean error rate **~same**

Model Selection	Boost 2 cycles	Boost 4 cycles	Boost 6 cycles	Boost 8 cycles	Boost 10 cycles	Boost 12 cycles	Boost 14 cycles	Boost 16 cycles
K=1 nearest neighbors								
K=5		best						
K=10								
K=30								
K=50								

© R.A. Rutenbar 2003 Slide 51

Observations

■ First rigorous application of **data-mining** in ckt modeling

- ▼ We can build usefully accurate predictive models of lots of high-dim data
- ▼ Boosting is an elegant, robust fitting framework for exploration here

■ Rigorous **model selection** makes models easier to use

- ▼ Most users are not very familiar with regression jargon or parameters
- ▼ Sensible application of selection / validation lets us auto-pick a 'best' model

■ Interesting **connections** to recent "simulation-directed" models

© R.A. Rutenbar 2003 Slide 52

Recall How Trajectory-Based Methods Work

- Simulate training inputs in state space
- Choose center pts on this trajectory
- Build simple local model near each pt projecting down to a smaller state vec
- Distance-weighted voting to compute predicted dynamics

Multiple regressors, locally weighted, with saved training data...

© R.A. Rutenbar 2003 Slide 53

Summary

- **Macromodeling: Future looks pretty good (OK, glorious...)**
 - ▼ Because we don't have a choice, to do the systems we want to design
 - ▼ Because of many recent modeling innovations
- **Data mining: It's not just for dot-coms anymore**
 - ▼ Smart ways to handle large amounts of high-dimensional data
 - ▼ Smart ways to build and vote and validate ensembles of regressors
- **Simulation-based circuit optimization infrastructure**
 - ▼ Lots of companies making it possible to sample widely, cheaply, quickly
 - ▼ This will fundamentally change the way we get data to build macromodels

© R.A. Rutenbar 2003 Slide 54
